Vidit Singh Chauhan

DevOps Engineer

Ahmedabad | +91-9680959872 | singhvidit.chauhan@gmail.com | LinkedIn | GitHub

Summary

Recent CS graduate with hands-on DevOps experience building and owning production-grade infrastructure: Kubernetes-based staging environments, CI/CD pipelines for 55+ applications, and org-wide tooling migrations for a 25-person engineering team. Focused on SRE/DevOps roles, with a particular interest in Kubernetes-native infrastructure and cost-efficient observability stacks.

Technical Skills

DevOps Tools: Kubernetes (k8s, k3s), Docker, Helm, GitHub Actions, Jenkins, Python & Shell Scripting
Monitoring & Observability: Grafana, VictoriaMetrics, Loki & Prometheus
Cloud & Infrastructure: AWS, GCP, AWS CLI, AWS CloudFormation & Terraform
Version Control & Collaboration: Git, GitHub & Bitbucket
Networking: DNS, Load Balancing, Reverse Proxy & HTTP/HTTPS

Experience

Java Intern (DevOps & Infrastructure) January 2026 – Present
Qpaix Infitech Private Limited *Ahmedabad, Gujarat*

- Established **production-grade observability** on resource-constrained staging servers by migrating from **Apache Webserver & Tomcat** to **k3s**, replacing **Prometheus with VictoriaMetrics + Loki.**
- Cut tooling costs by **67% ($300 to $100/month)** by migrating 25 engineers from Jira+Bitbucket to GitHub Teams, replicating **full project management workflows** via GitHub Actions.
- Reduced deployment cycles from **bi-weekly releases to 2–3/day** by building CI/CD pipelines for **55+ apps** (React, Java, Python), cutting pipeline runtimes to **under 2 minutes.**
- Enforced schema change accountability by building a **version-controlled DB pipeline,** replacing a shared all-access DB user with **auditable deployment change logs**.
- Resolved dev environment inconsistencies by **centralizing staging DBs** and setting up **redundant MySQL and PostgreSQL** instances to ensure **continuity** during an infrastructure transition.
- Performed **performance testing** using **k6** across various application modules to validate system scalability and ensure reliability under load.

Projects

Automated Receipt Processing | GitHub
Python, S3, SES, Textract, Lambda, DynamoDB

- Developed a fully serverless data pipeline automating end-to-end expense tracking workflows, **eliminating manual data entry and reducing processing time**.
- Utilized **AWS Textract** to achieve over **95% accuracy** in extracting key-value pairs and line items from unstructured receipt images, storing parsed data in DynamoDB.
- Integrated **AWS Simple Email Service (SES)** to **automatically notify** users with extracted receipt information, finalizing the automated process.

DevOps Pipeline & Kubernetes Research | GitHub
k3s, GitHub Actions, Grafana, VictoriaMetrics, Loki, Docker, Java, React

- Evaluated **4 Kubernetes distributions (kubeadm, kind, minikube, k3s)** across RAM and resource benchmarks, selecting **k3s** as the optimal low-resource solution.
- Built a full CI/CD pipeline for Java and React applications covering **build, test, and deploy** stages on a **self-hosted k3s cluster.**
- Configured a **custom observability stack (Grafana, VictoriaMetrics, Loki)** with developer-facing dashboards tailored for deployment monitoring and log aggregation.

Education

Gujarat Technological University Ahmedabad, Gujarat
BE in Computer Engineering | CGPA: 9.26 | CPI: 8.45 *Sept 2022 – Jun 2026*

- **Relevant Coursework:** Cloud Computing, Computer Networking, Database Management System, Operating System, Artificial Intelligence & Information Security.
